

DATA VISUALIZATION PROJECT — MICHELIN STAR

- What is the problem being addressed?
 - Enhance the Michelin guide and make it more accessible for users who wish to find a restaurant
 - Giving recommendations and filtering based on price point, cuisine, user location...
- Where is the data coming from and what are its characteristics? Make sure to describe the data and its attributes in detail. If it's very complex, provide details in the Appendix (i.e., additional slides at the end).
 - GitHub: <https://github.com/mayaradaher/michelin-app/tree/main/data/raw>
 - Characteristics

Variable	Type	Description
<code>name</code>	Categorical (nominal)	Restaurant name
